## INTRODUCTION

This traffic study was performed to determine the impacts associated with the development of the new Lacamas Heights Elementary School in the Camas School District in the City of Camas. The impact area as defined based on input received from the City staff included the school's frontage area on NE 232<sup>nd</sup> Avenue and several key intersections occurring along NE 232<sup>nd</sup> Avenue, NE 28<sup>th</sup> Street, and 267<sup>th</sup> Avenue. The school property is situated on the north side of 9<sup>th</sup> Street east of 232<sup>nd</sup> Avenue. The site location is highlighted on the vicinity map (Figure 'a') in the appendix. Site layout including placement on the school building, parking lot, sports fields, and driveway locations on 232<sup>nd</sup> Avenue Street are shown on Figure 'b'.

The project proposes to construct a new elementary school to replace the existing Lacamas Heights Elementary School now located adjacent to the high school campus along SE 15<sup>th</sup> Street. The new elementary school will serve 600 students. The school will operate on a standard 180 day school year during the hours of 9:00 AM to 3:30 PM. Traffic access to the site is being planned for two accesses on the east side of 232<sup>nd</sup> Avenue as illustrated on the site plan. The north access will serve all non-bus traffic and the south access will be reserved for school busses.

In the project scope established with the City of Camas a number of important elements were identified and considered in the study.

- Projecting site generated traffic relative for 600 students. Trip rates were applied from the ITE Trip Generation Manual (9<sup>th</sup> Edition, year 2012).
- Distribution of site generated trips was based on the District's service area and boundary information, traffic volume counts, circulation patterns, and engineering judgment.
- Background traffic was established from several in-process traffic projects identified by the City. Application of annual traffic growth was not necessary in the analysis as confirmed by staff.
- Documentation of pedestrian, bicycle, and transit facilities in the study area.
- Evaluation of sight distance at the site access point on 9<sup>th</sup> Street.
- Determination of left turn lane requirements and peak hour signal warrants.
- Capacity analysis of four study intersections including 232<sup>nd</sup> Avenue at 9<sup>th</sup> Street, 232<sup>nd</sup> at 28<sup>th</sup> Street, 242<sup>nd</sup> Avenue at 28<sup>th</sup> Street, 267<sup>th</sup> Avenue at 19<sup>th</sup> Street, and the site accesses on 232<sup>nd</sup> Avenue. The peak hour periods during the weekday AM, mid-afternoon, and PM were analyzed for the existing, background year 2018, and total traffic year 2018 scenarios.
- Review of the existing travel lane and traffic control conditions.
- Level of service analysis of the study intersections to confirm the locations not meeting the City's mobility standards and the required mitigation.
- Documentation of the study area streets and intersections included in the City's TIF Update (May 2012).
- Review of WSDOT furnished crash history data to assess if there have been safety issues that must be mitigated.

The Appendix to the report contains technical data including a vicinity map, site plan, traffic flow mapping, left turn lane & signal warrants, lane and traffic control plan, and the capacity analysis outputs.

## SITE DESCRIPTION, STREETS, AND CRITICAL INTERSECTIONS

The project site is located in north Camas approximately a quarter-mile north of Lacamas Lake on the east side of 232<sup>nd</sup> Avenue. The surrounding land is sparsely developed and consists mainly of forested and farm property. The site is situated close to the District's west boundary with most of the service area extending to the east, south, and north.

Intersection sight distance at the future access points on 232<sup>nd</sup> Avenue (final location still to be determined) will need to meet AASHTO's standard based on the street's 40 MPH speed. For 40 MPH the required intersection sight distance is 445 feet.

**Northeast 232<sup>nd</sup> Avenue** is classified as an arterial and currently provides one lane in each direction. There are minimal shoulders with approximately one to two feet of width and the travel speed is posted at 40 MPH. There is a moderate uphill grade to the north from the 9<sup>th</sup> Street intersection. Appropriate school zone signing will need to be posted including school symbol signs in advance of the site access points.

The intersection of **9<sup>th</sup> Street at 232<sup>nd</sup> Avenue** is configured as a tee-shaped design with stop control on the 9<sup>th</sup> Street approach. A dead-end sign is present on 9<sup>th</sup> Street. There are no separate turn lanes at this location.

**Northeast 232<sup>nd</sup> Avenue at 28<sup>th</sup> Street** (classified as an arterial) is a four-way configuration controlled by stop signing on the northbound approach. The north leg is a private road serving several residences and is not signed for stop control. There are no separate turn lanes at the intersection. A large two-way arrow-board sign is posted on the north side of the intersection for northbound traffic.

**Northeast 28<sup>th</sup> Street at 242<sup>nd</sup> Avenue** is configured as a tee-shaped design with stop sign control established for southbound traffic. There is a private driveway approach on the south leg. There are no separate turn lanes at the intersection.

**Northeast 19<sup>th</sup> Street at 267<sup>th</sup> Avenue** is configured as a tee-shaped design with stop sign control established for eastbound traffic. There is a private driveway approach on the west side of the intersection. There are no separate turn lanes at the intersection.

The existing lane configuration and traffic control elements are shown on Figure 'c'.

## TRAFFIC OPERATIONAL ANALYSIS

Four intersections were analyzed for level of service (LOS) conditions as stipulated in the project scoping established with the City of Camas. LOS analyses were completed for the study intersections during the peak hour periods under several scenarios:

- Existing traffic year 2015
- Background traffic year 2018
- Total traffic year 2018

In order to perform the LOS analysis at the critical intersections video traffic counts were recorded during the AM peak (7:15-9:15 AM), mid-afternoon (1:45-3:45 PM), and PM peak (4:00-6:00 PM) traffic hours. The existing traffic volumes are shown on Figure 1 in the report's appendix.

Background traffic is comprised of the existing and the in-process traffic that was specified by the City. The in-process traffic is shown on Figure 2 and the year 2018 background traffic volumes are shown on Figure 3.

Figure 4 illustrates the trip assignments for the school bus routes in the study area.

Figure 5 exhibits the distribution for the non-bus traffic associated with the new school. The distribution was based on the service and boundary vicinity, traffic volume counts, circulation patterns, and engineering judgment. Figure 6 illustrates the site generated trip assignments covering the AM, mid-afternoon, and PM peak hours. Generated traffic was developed from the number of trips associated with 600 students.

The total traffic scenario was derived from the summation of the background and the school's site generated traffic. The total traffic scenario is depicted on Figure No. 7.

## VEHICLE TRIP GENERATION

Vehicle trip generation rates were calculated based on historical data contained in the ITE Trip Generation manual (9<sup>th</sup> Edition, 2012). Trip rates for the elementary school were applied from the manual using ITE code #520.

Over a 24-hour weekday period a total of 774 trip ends are projected to occur when the school begins operation. During the AM, mid-afternoon, and PM peak hours a total of 270, 168, and 90 trips, respectively will be generated in the peak hours.

**Table 1 Trip Generation Summary**

ITE Land Use	Units (Students)	ADT	Weekday								
			AM Peak Hour			Mid-Afternoon Peak Hour			PM Peak Hour		
			Total	Enter	Exit	Total	Enter	Exit	Total	Enter	Exit
Elementary School (#520)	600	1.29	0.45	55%	45%	0.28	45%	55%	0.15	49%	51%
Generation Rate <sup>1</sup>		<b>774</b>	<b>270</b>	149	121	<b>168</b>	76	92	<b>90</b>	44	46
Site Trips											

<sup>1</sup> Source: *Trip Generation*, 9th Edition, ITE, 2012, average rates.

## TRAFFIC FLOW AND CAPACITY ANALYSIS RESULTS

The traffic flow maps included in the appendix showing the traffic volume data and turning movements for the weekday peak hour conditions were used in the capacity analysis. The study intersections were evaluated for the existing, year 2018 background, and year 2018 total traffic scenarios during the AM, mid-afternoon, and PM peak hours. Synchro version #9 software employing the year 2010 Highway Capacity Manual methodology was applied in performing the intersection capacity analyses.

The City's mobility standards require that a LOS 'D' and a volume to capacity (v/c) ratio of 0.90 or better be maintained for all intersections. The standards are documented in the City of Camas Comprehensive Plan, Transportation Element, Policy TR-20 dated March 2004.

Table 2 presents a summary of the capacity analysis results determined in the study.

**Table 2 Capacity Analysis Summary**

Intersection	Type of Control	Peak Hour	Traffic Scenario								
			2015 Existing				2018 Background				2018 Total
			Crit. Mov't	LOS	Delay	v/c	Crit. Mov't	LOS	Delay	v/c	Crit. Mov't

Notes: 2010 Highway Capacity Manual methodology used in analysis, Synchro v9. NB - Northbound, SB - Southbound, WB - Westbound, Crit. Mov't - Critical movement or critical approach.

<sup>1</sup> Mitigation: Construct a northbound left turn lane on NE 232nd Avenue at NE 28th Street.

<sup>2</sup> Mitigation: Not Recommended - Traffic Signal.

With the exception of the intersection at 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue the study intersections will operate at acceptable LOS 'D' or better during the peak hours for the existing, year 2018 background, and year 2018 total traffic scenarios.

The proposed non-bus traffic access (major access, worst case) on 232<sup>nd</sup> Avenue will operate at LOS 'B' or better through the year 2018 total traffic scenario.

The northbound stop controlled movement at 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue is currently operating at LOS 'B'. In the year 2018 background scenario the intersection will experience LOS 'E' in the PM peak hour. For the year 2018 total traffic scenario the intersection is projected to operate at LOS 'F' in the AM and PM peak hours. Potential mitigation includes signalization or adding a second northbound lane to create separate left and combination through/right lanes. Although the peak hour signal warrant is met in the year 2018 background and total traffic scenarios installation is not recommended because a future east-west collector street extending Ingle Road from 28<sup>th</sup> Street to 232<sup>nd</sup> Avenue includes a roundabout at the 232<sup>nd</sup> Avenue intersection ([City of Camas TIF Project Locations, May 2012](#)). When the future collector is constructed (no defined schedule in place) it is anticipated that the traffic volumes at 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue will significantly decrease negating the need for a signal as confirmed in the City's TIF Update report (May 2012, DKS) for the year 2035 scenario. As an interim step it is recommended that a second northbound lane be added on the south intersection leg. With this improvement the northbound left turn lane will still operate at LOS 'F' until the round-about is constructed in conjunction with the Ingle Road extension to 232<sup>nd</sup> Avenue.

Generally, LOS 'A', 'B', 'C', and 'D' are desirable service levels ranging from no vehicle delays to average or longer than average delays in the peak hours. Level 'E' represents long delays indicating signalization warrants need to be reviewed and signals considered only if warrants are met. Level 'F' indicates that intersection improvements, such as widening and signalization, may be required. By definition, and according to the [Highway Capacity Manual \(HCM\)](#), the following delay times are associated with the LOS at stop controlled (unsignalized) and signalized intersections.

#### **Level of Service criteria defined in *Highway Capacity Manual*.**

Level of Service (LOS)	Unsignalized Control	Signalized Control
	Stopped Delay (sec/veh)	Stopped Delay (sec/veh)
A	≤ 10	≤ 10
B	> 10 and ≤ 15	> 10 and ≤ 20
C	> 15 and ≤ 25	> 20 and ≤ 35
D	> 25 and ≤ 35	> 35 and ≤ 55
E	> 35 and ≤ 50	> 55 and ≤ 80
F	> 50	> 80

## **LEFT TURN LANE REQUIREMENTS**

A series of left turn lane warrant analyses were performed for the study intersections and the site access intersections. The study revealed that a westbound left turn lane is warranted for the year 2018 total traffic scenario at the intersection of 28<sup>th</sup> Street at 232<sup>nd</sup> Avenue. Installation of the westbound left turn lane is not recommended considering the peak hour LOS and queuing results (WB approach LOS 'A', 95<sup>th</sup> percentile queue of one vehicle). It is also noted that with the future Ingle Road extension between 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue eastbound (opposing) traffic at 232nd Avenue/28<sup>th</sup> Street will decrease benefiting the westbound to southbound movement.

Based on the street's functional classification as an arterial, 40 MPH speed, and for safety reasons it is recommended that southbound left turn lanes be installed on 232<sup>nd</sup> Avenue at the site access intersections. For the non-bus (north) access the storage length will need to accommodate sufficient stacking distance for eight vehicles or 200 feet. At the south site access (bus entrance) the stacking distance should accommodate a minimum of three busses in the AM peak hour (worst case peak period) for a recommended storage length of 200 feet.

The left turn lane data and warrants are contained in the appendix.

## **TRAFFIC SIGNAL WARRANTS**

The study intersections were reviewed for signalization needs based on the peak hour signal warrant contained in the Manual on Uniform Traffic Control Devices (MUTCD). The peak hour warrant was met at the following locations.

- 28<sup>th</sup> Street/232<sup>nd</sup> Avenue for the year 2018 background and total traffic scenarios (signal not recommended, instead mitigate by adding second northbound lane)
- 28<sup>th</sup> Street/242<sup>nd</sup> Avenue for the year 2018 total traffic scenario (future signal planned as TIF project, signal not recommended in conjunction with new elementary school development as the current stop controlled intersection will experience LOS 'D' or better through the year 2018 total traffic periods and no crashes were reported within the last five years)
- 19<sup>th</sup> Street/267<sup>th</sup> Avenue for the year 2018 total traffic scenario (signal not recommended as the current stop controlled intersection will experience LOS 'D' or better through the year 2018 total traffic periods and no reported crashes were reported within the last five years)

## **PEDESTRIANS, BICYCLE, & BUSSES**

The project site is situated within a sparsely developed area that does not currently provide facilities for pedestrians, bicyclists, or transit. With the project development sidewalk will be provided on site and along the street frontage adjacent to the school. Appropriate school zone signing including advance symbol will be placed on 232<sup>nd</sup> Avenue in conjunction with the project.

No bicycle lanes are present within the general area.

C-Tran does not provide transit service in this area of Camas.

## **INTERSECTION SIGHT DISTANCE**

Intersection sight distance was reviewed on 232<sup>nd</sup> Avenue along the project frontage. The current vertical grade is moderate resulting in favorable sight distance near the preliminary site access locations. When the site locations are finalized it is recommended that sight distances be reassessed in conformance with the AASHTO standards based on a travel speed of 40 MPH. For 40 MPH the required intersection sight distance is 445 feet.

## **TRAFFIC SAFETY**

Accident data for the study intersections was provided by WSDOT and reviewed to help identify any traffic safety problems. The data covered a five-year study period in the years 2010 through 2014 (reference appendix).

The crash rates are presented in Table 3 and are based on the number of accidents per million entering vehicles (MEV) per year. Typically, an intersection is not considered unsafe unless the accident rate exceeds the threshold of 1.0 accident per MEV.

None of the study intersections have experienced a crash rate of greater than 0.46 MEV and as a result no safety mitigation is necessary.

**Table 3 Intersection Crash Rate Summary**

Intersection	Accident History (Years)	Number of Accidents	Accidents per year	Annual Traffic Entering (veh/yr)	Accident rate per M.E.V.*
NE 28th Street & NE 232nd Avenue	5	1	0.2	1654537	<b>0.12</b>
NE 9th Street & NE 232nd Avenue	5	1	0.2	430983	<b>0.46</b>
NE 242nd Avenue & NE 28th St/Dresser Rd	5	0	0.0	1614361	<b>0.00</b>
NE 19th Street and NE 267th Avenue	5	0	0.0	2038039	<b>0.00</b>

\* M.E.V. - million entering vehicles.

## SUMMARY AND RECOMMENDATIONS

The development plan for Lacamas Heights Elementary School will construct a new 70,000 square foot building providing for a total of 600 students. The traffic impact area as defined based on input received from City of Camas transportation staff included the school's immediate frontage area and analysis of several off-site intersections including NE 232<sup>nd</sup> Avenue at the future site access points and at 28<sup>th</sup> Street, and 242<sup>nd</sup> Avenue at 28<sup>th</sup> Street, and 267<sup>th</sup> Avenue at 19<sup>th</sup> Street. The site location is shown on Figure 'a' in the report's appendix. Traffic access to the school will be provided on 232<sup>nd</sup> Avenue and is illustrated on the site plan (Figures 'b').

The new elementary school is projected to generate 774 trips per day. A total of 270 trips will be generated in the AM peak hour, 168 trips generated in the mid-afternoon peak hour, and 90 trips generated in the PM peak hour. Table 1 in the report exhibits the project trip generation.

The traffic analysis documented the impacts to the existing street system. Traffic scenarios included the weekday peak traffic hours occurring during the AM, mid-afternoon, and PM periods. Year 2015 existing traffic, year 2018 background traffic, and year 2018 total traffic scenarios were evaluated in the study.

The proposed site access on 232<sup>nd</sup> Avenue for non-bus traffic (north access) will operate at LOS 'B' or better through the year 2018 total traffic scenario. It will be necessary to install a stop sign on the proposed site access approaches to 232<sup>nd</sup> Avenue for traffic control and safety purposes. A stop bar pavement marking shall also be installed at each location.

With exception of the intersection at 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue the other study intersections will operate at acceptable LOS 'D' or better during the peak hours for the existing, year 2018 background, and year 2018 total traffic scenarios. At these locations no mitigation is proposed.

For the intersection at 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue the northbound stop controlled movement currently operates at LOS 'B'. In the year 2018 background scenario it will experience LOS 'E' due to

the addition of in-process traffic. For the year 2018 total traffic scenario the intersection is projected to operate at LOS 'F' in the AM and PM peak hours. The recommended mitigation includes adding a second northbound lane to create separate left and combination through/right lanes. Although the improvement will still result in LOS 'F' for the left turn movement the v/c ratio will equate to 0.88 on the stop controlled approach in the PM peak hour (year 2018 total traffic scenario, worst case). The v/c ratio combining both northbound lanes equates to a value of 0.34 at buildout. Additional improvements are not recommended because a future east-west collector street extending Ingle Road from 28<sup>th</sup> Street to 232<sup>nd</sup> Avenue includes a roundabout at the 232<sup>nd</sup> Avenue intersection (City of Camas TIF Project Locations, May 2012). When the future collector is constructed it is anticipated that the traffic volumes at 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue will significantly decrease negating the need to make significant improvements as confirmed in the City's TIF Update report (May 2012, DKS) for the year 2035 scenario.

The analyses determined that a westbound left turn lane is warranted for the year 2018 total traffic scenario at the intersection of 28<sup>th</sup> Street at 232<sup>nd</sup> Avenue. Installation of the westbound left turn lane is not recommended considering the LOS and queuing results (WB approach LOS 'A', 95<sup>th</sup> percentile queue of one vehicle). It is also noted that with the future Ingle Road extension between 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue eastbound traffic at 232nd Avenue/28<sup>th</sup> Street will decrease benefiting the westbound to southbound movement.

Southbound left turn lanes are recommended on 232<sup>nd</sup> Avenue at the two site access locations based on the street's functional classification as an arterial, travel speed (posted 40 MPH), and safety reasons. For the non-bus (north) access the storage length will need to accommodate sufficient stacking distance for eight vehicles or 200 feet. At the south site access (bus entrance) the stacking distance should accommodate a minimum of three busses in the AM peak hour (worst case peak period) with the recommended storage length of 200 feet.

Peak hour signal warrants were determined for the study intersections.

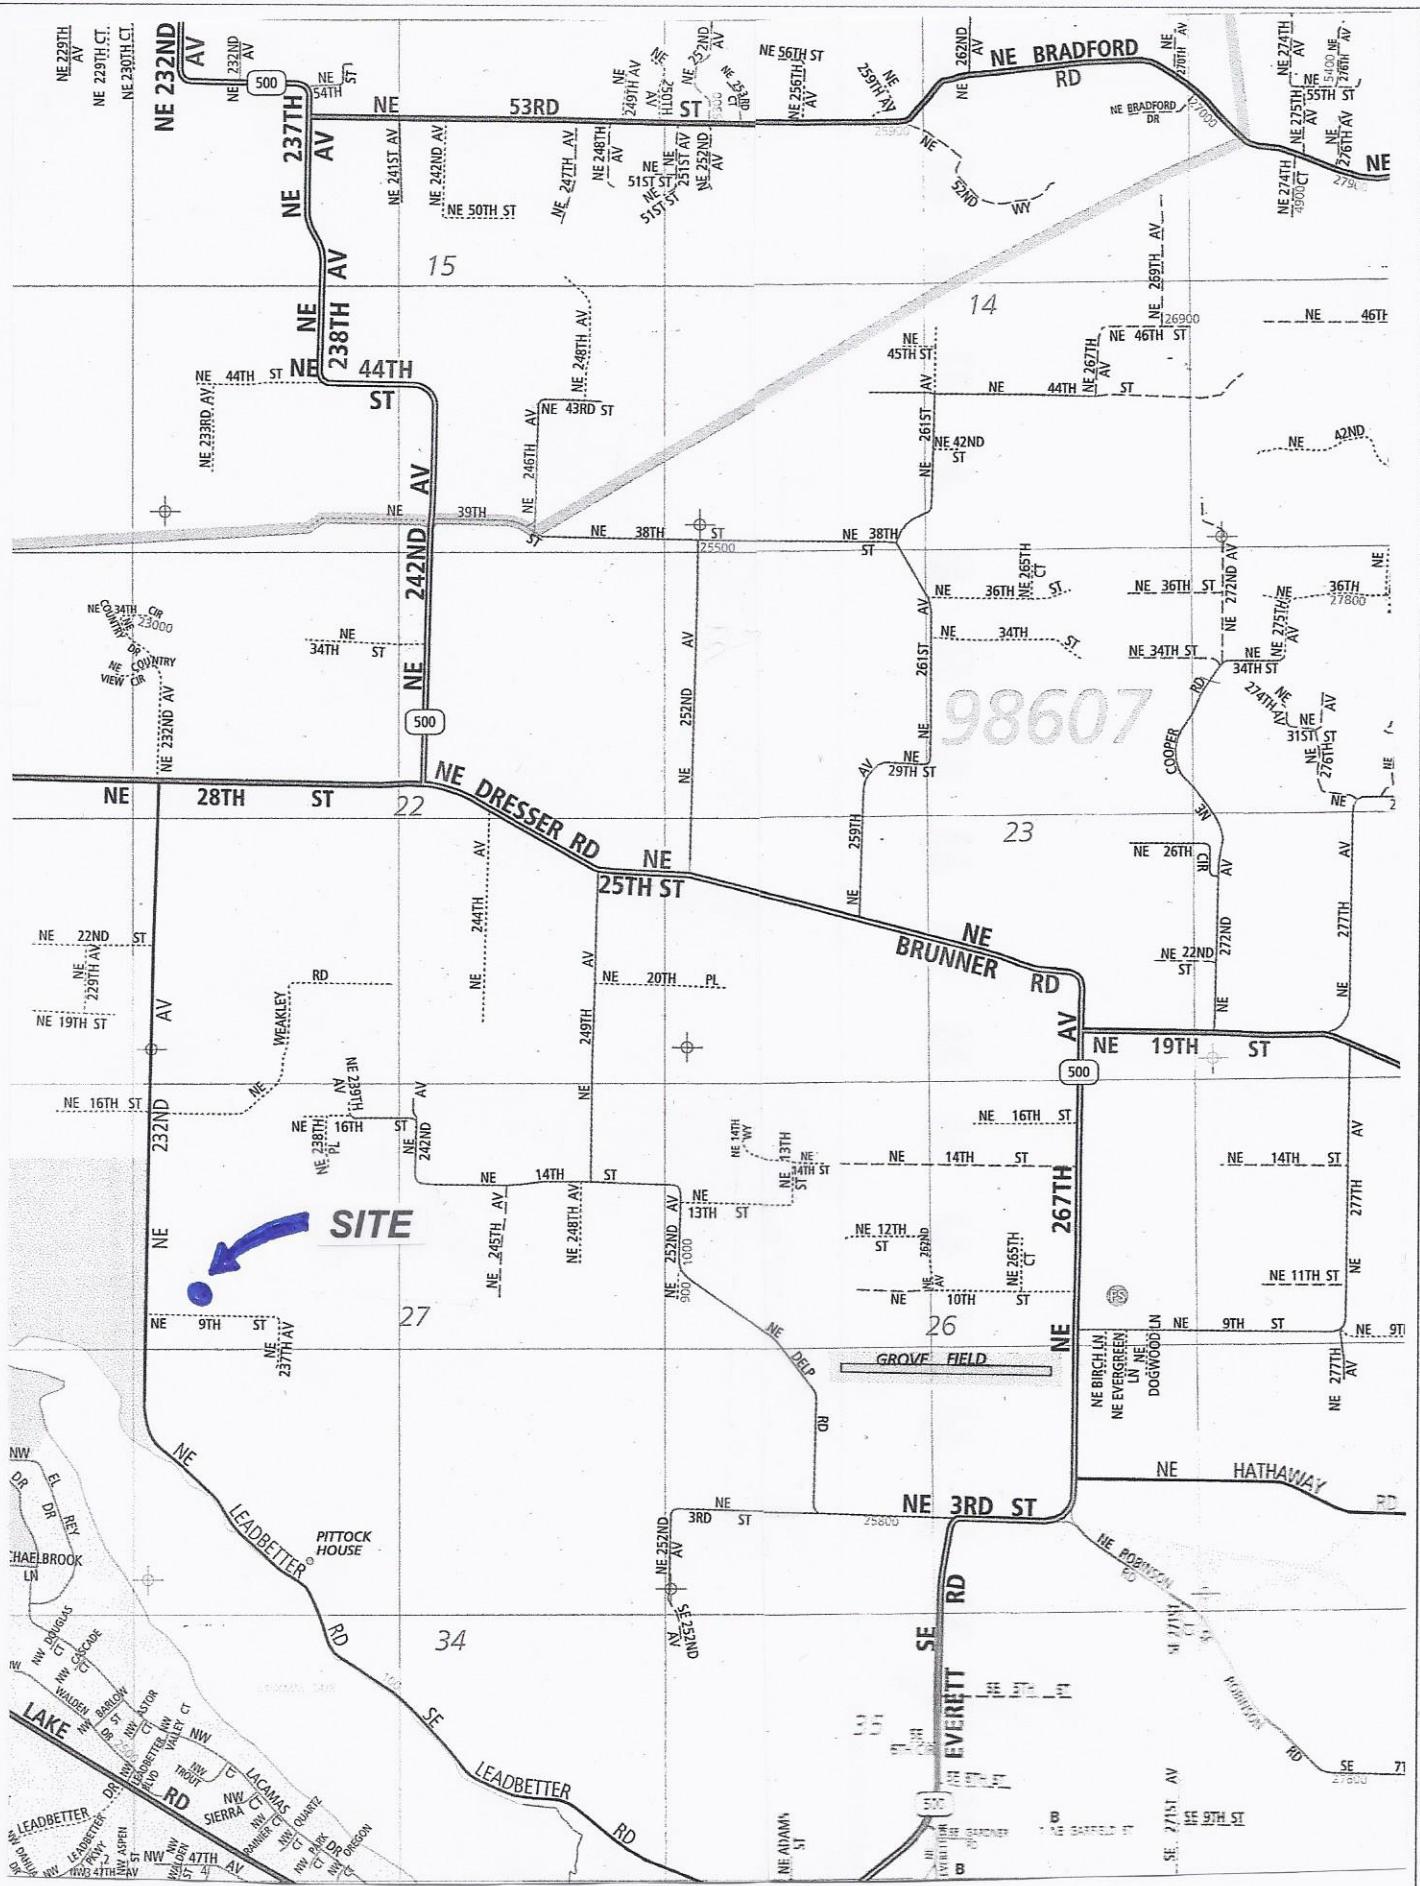

At 28<sup>th</sup> Street and 232<sup>nd</sup> Avenue the warrant is met for the year 2018 background and total traffic scenarios. A signal installation is not recommended as the intersection will be mitigated by adding a separate northbound left turn lane.

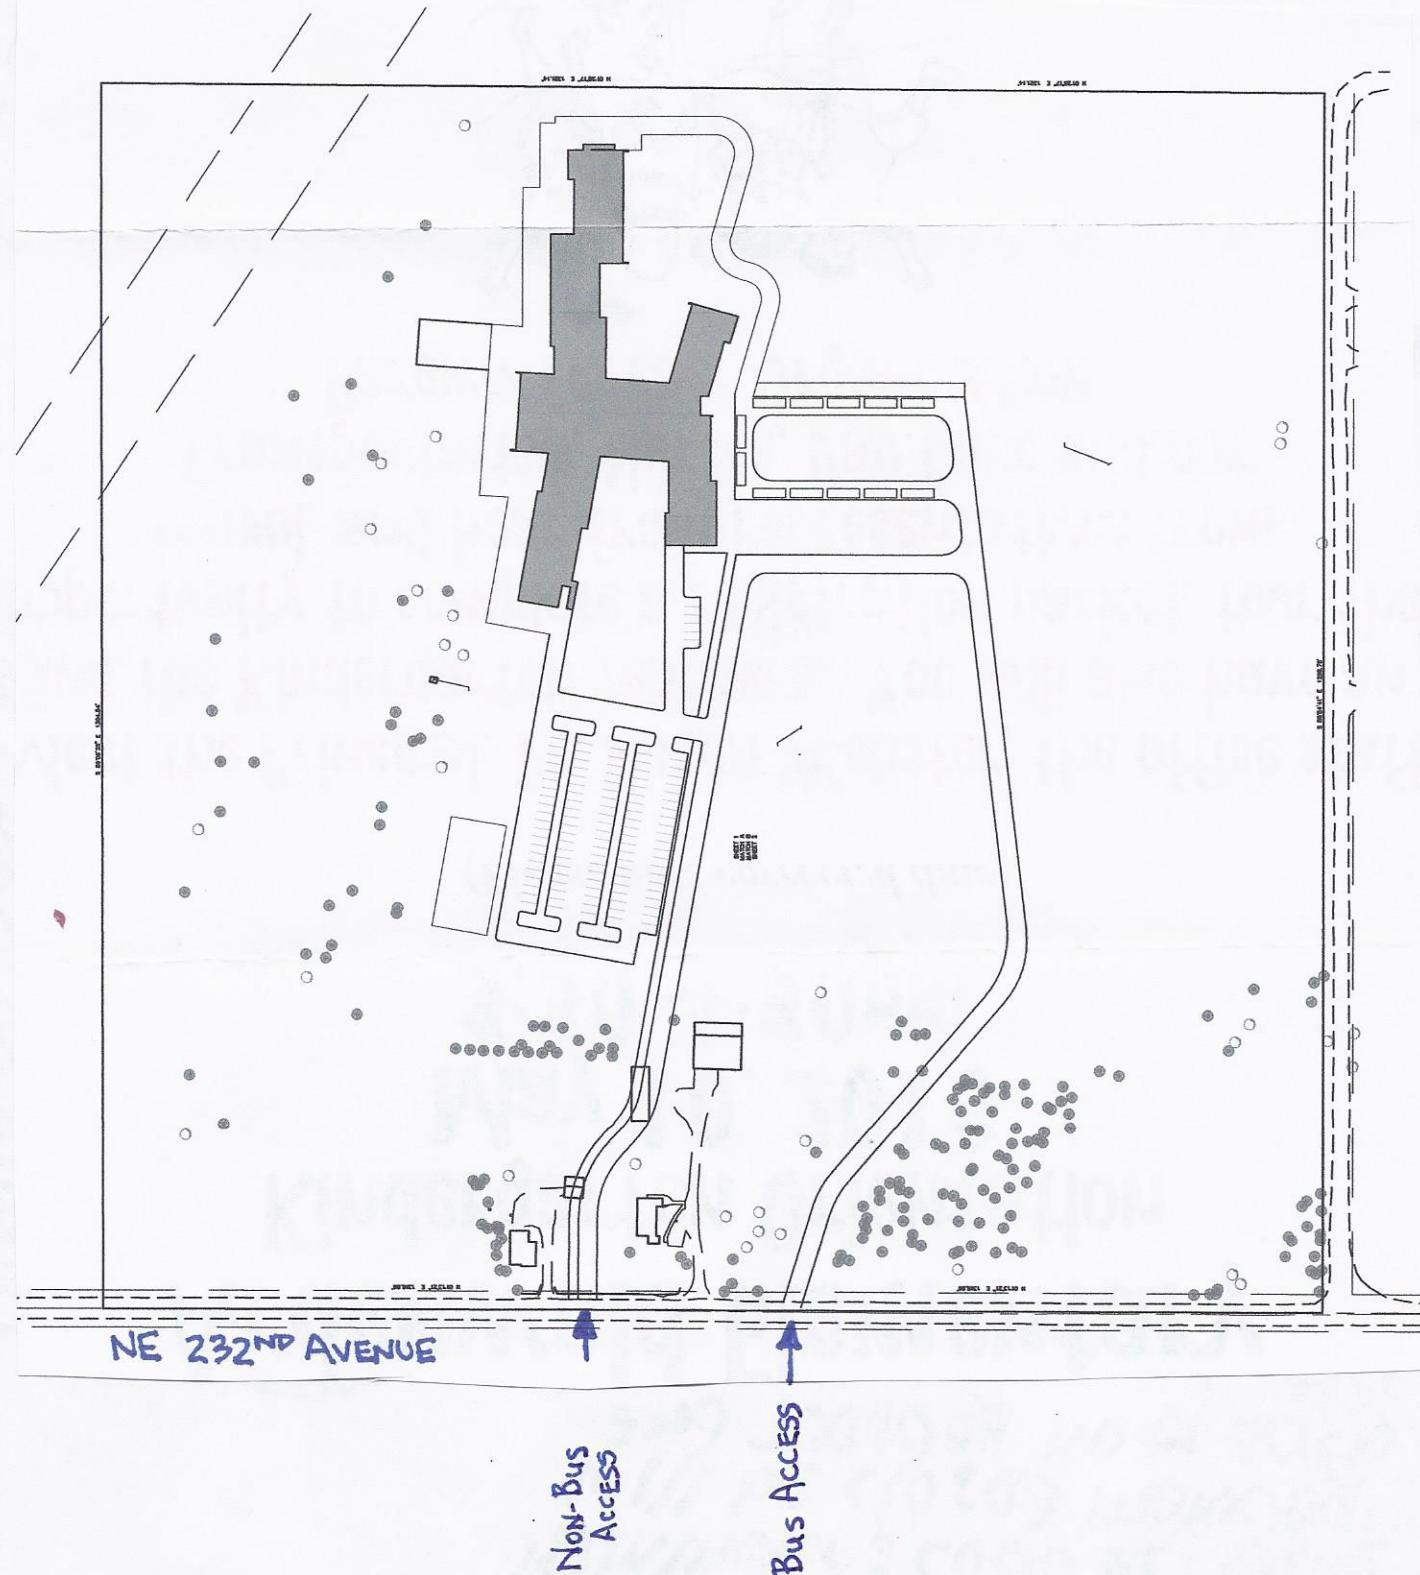

At 28<sup>th</sup> Street and 242<sup>nd</sup> Avenue the signal warrant is met for the year 2018 total traffic scenario. The signal need has also been identified by the City as a future TIF project. However, signalization is not recommended in conjunction with new elementary school development as the intersection will experience LOS 'D' or better through the year 2018 total traffic periods and no reported crashes have been reported within the last five years.

At 19<sup>th</sup> Street and 267<sup>nd</sup> Avenue the signal warrant is met for the year 2018 total traffic scenario. However, signalization is not recommended in conjunction with new elementary school development as the intersection will experience LOS 'D' or better through the year 2018 total traffic periods and no reported crashes have been reported within the last five years.

**Cc:** Heidi.Rosenberg@Camas.wednet.edu; Chris Robertson; Jeremy Fick  
**Subject:** RE: Lacamas Heights E.S. - 232nd Ave/28th St

### Clark County Concurrency

The proposed development is required to meet the standards established in CCC 41.350.020(G) for corridors and intersections of regional significance. Typically, the County's transportation model is used to determine what urban area developments are currently being reviewed, approved, or are under construction and in the vicinity of the proposed development. The traffic these developments generate is referred to as "*in-process traffic*" and will ultimately contribute to the same roadway facilities as the proposed development. This "*in-process traffic*" is used to evaluate and anticipate area growth and its impact on intersection and roadway operating levels with and without the proposed development, helping to determine if roadway mitigation necessary to reduce transportation impacts.

### Unsignalized Intersections

The applicant has submitted a traffic study that reports anticipated levels-of-service on the intersection of NE 28<sup>th</sup> Street/NE 232<sup>nd</sup> Avenue. This intersection was reported to have a level-of-service "F" on the stop controlled approach in the 2018 evaluation year with the proposed development. The applicant's traffic study also indicates that there are vehicle trips assigned to the failing approach in this intersection.

The applicant has provided an email (below) to supplement the submitted traffic study dated May 25, 2016. The supplemental email has analyzed the impacts of the proposed development on the intersection approaches, listed above, to determine if mitigation requirements would be warranted per CCC 40.350.020 (G)(1)(c).

The applicant's analysis compared the anticipated impacts against the criteria in the code section listed above and found that only one (1) of the three (3) criterion were met. Staff concurs with the applicant's findings.

The County has determined that this development can comply with adopted Concurrency Standards for unsignalized intersections.

### **SAFETY:**

Mitigation for off-site safety deficiencies may only be a condition of approval on development in accordance with CCC 40.350.030(B)(6). The code states that "nothing in this section shall be construed to preclude denial of a proposed development where off-site road conditions are inadequate to provide a minimum level of service as specified in Section 40.350.020 or a *significant* traffic or safety hazard *would be caused or materially aggravated* by the proposed development; provided, that the applicant may voluntarily agree to mitigate such direct impacts in accordance with the provisions of RCW 82.02.020."

### Crash History

The applicant's traffic study analyzed the crash history as obtained from Washington State Department of Transportation (WSDOT) for the period 2010 through 2014.

The intersection crash rates, for the study intersection did not exceed thresholds that would warrant additional analysis. However, Staff did review the reported crash at the intersection of NE 28<sup>th</sup> Street/NE 232<sup>nd</sup> Avenue to understand the crash type. Staff's review found that the crash was due to an animal in the roadway.

The applicant's study did not recommend any safety mitigations as a part of this development. Staff concurs with the applicant's finding.

Based on Staff's review of the applicant's materials, no further analysis or mitigation is required. Thank you for the opportunity to comment.

**To:** Jardin, David

**Subject:** Lacamas Heights E.S. - 232nd Ave/28th St

David – As discussed this morning I am documenting the pertinent code section and the associated requirements for concurrency approval related to the intersection conditions for NE 232<sup>nd</sup> Avenue and 28<sup>th</sup> Street in Clark County.

The traffic report dated 5/25/16 prepared for the Lacamas Heights Elementary School recently copied to you determined that the subject intersection would reach LOS 'F' for the year 2018 total traffic scenario unless mitigated by signalization. Code section 40.350.020(G)(1)(c) indicates that proposed developments shall not be required to mitigate their impacts in order to obtain concurrency approval unless meeting all three of the following:

1. The proposed development adds at least five (5) peak period trips to a failing intersection approach;
2. The projected volume to capacity ratio for the worst lane movement on the approach with the highest delay exceeds nine-tenths (0.9) during the peak traffic period; and
3. That same movement is worsened by the proposed development.

Stipulation #2 above pertaining to the volume to capacity (v/c) will not be met as the worst lane movement v/c (northbound left turn) remains below 0.9 in the peak hours. In fact the v/c equates to 0.58 for the year 2018 total traffic AM peak hour and 0.78 for the year 2018 total traffic PM peak hour. The ratios are summarized below using the LOS results contained in the traffic report for the new Lacamas Heights Elementary School.

Year 2018 Total, AM Peak Hour

Left Turn Demand = 178  
Approach Capacity = 308  
v/c = 0.58

Year 2018 Total, PM Peak Hour

Left Turn Demand = 214  
Approach Capacity = 275  
v/c = 0.78

Other supporting factors to consider for not mitigating the intersection include.

- Signalization is not warranted
- The proposed school will add only two vehicle trips to the northbound left turn movement in the AM peak hour and one trip in the PM peak hour.
- The City of Camas has identified a future TIF roadway and intersection project to install a roundabout at 232<sup>nd</sup> Avenue & 22<sup>nd</sup> Avenue. The future improvement will connect to Ingle Road and lessen the traffic volume on the northbound approach of 232<sup>nd</sup> Avenue at 28<sup>th</sup> Street.
- The School District would have to obtain right-of-way to widen the intersection if the northbound approach were to add another travel lane.

Based on these considerations it is recommended the County not require mitigation at the intersection of NE 232<sup>nd</sup> Avenue and 28<sup>th</sup> street in conjunction with the Lacamas Heights Elementary School development project.

We would appreciate receiving your input regarding this recommendation as soon as possible. At that point we would provide the findings to the City of Camas for review.

Please do not hesitate to contact me if you have any questions.

## MEMORANDUM

Date: June 17, 2016

To: Jeremy Fick, PE  
Robertson Engineering, PC  
610 Esther Street  
Vancouver WA 98660

From: Frank Charbonneau, PE, PTOE

Subject: **NE 232<sup>nd</sup> Avenue & 9<sup>th</sup> Street Intersection Analysis**  
City of Camas & Lacamas Heights Elementary School

copy: Heidi Rosenberg  
Camas School District

FL1666

Charbonneau Engineering has completed the traffic analyses for the NE 232<sup>nd</sup> Avenue and 9<sup>th</sup> Street intersection proposal being planned in Camas.

The traffic work included a level of service (LOS) analysis for the realignment of 232<sup>nd</sup> Avenue at 9<sup>th</sup> Street and the access for the still unbuilt Lacamas Heights Elementary School. The concept plan developed by Robertson Engineering includes a new northbound stop approach that will tee into the 232<sup>nd</sup> Avenue and 9<sup>th</sup> Street curved alignment. Figure `a` attached to this memo illustrates the intersection layout and traffic control.

To complete the traffic analyses it was necessary to implement volume data established from the Lacamas Heights Elementary School traffic study completed in May 2016. The total traffic volumes included on Figure 7 in the report were used as the basis for the year 2025 conditions. These numbers included the in-process traffic and the school's trip generation. The data was considered sufficient for this analysis and is supported by City engineering staff, Jim Carothers, PE.

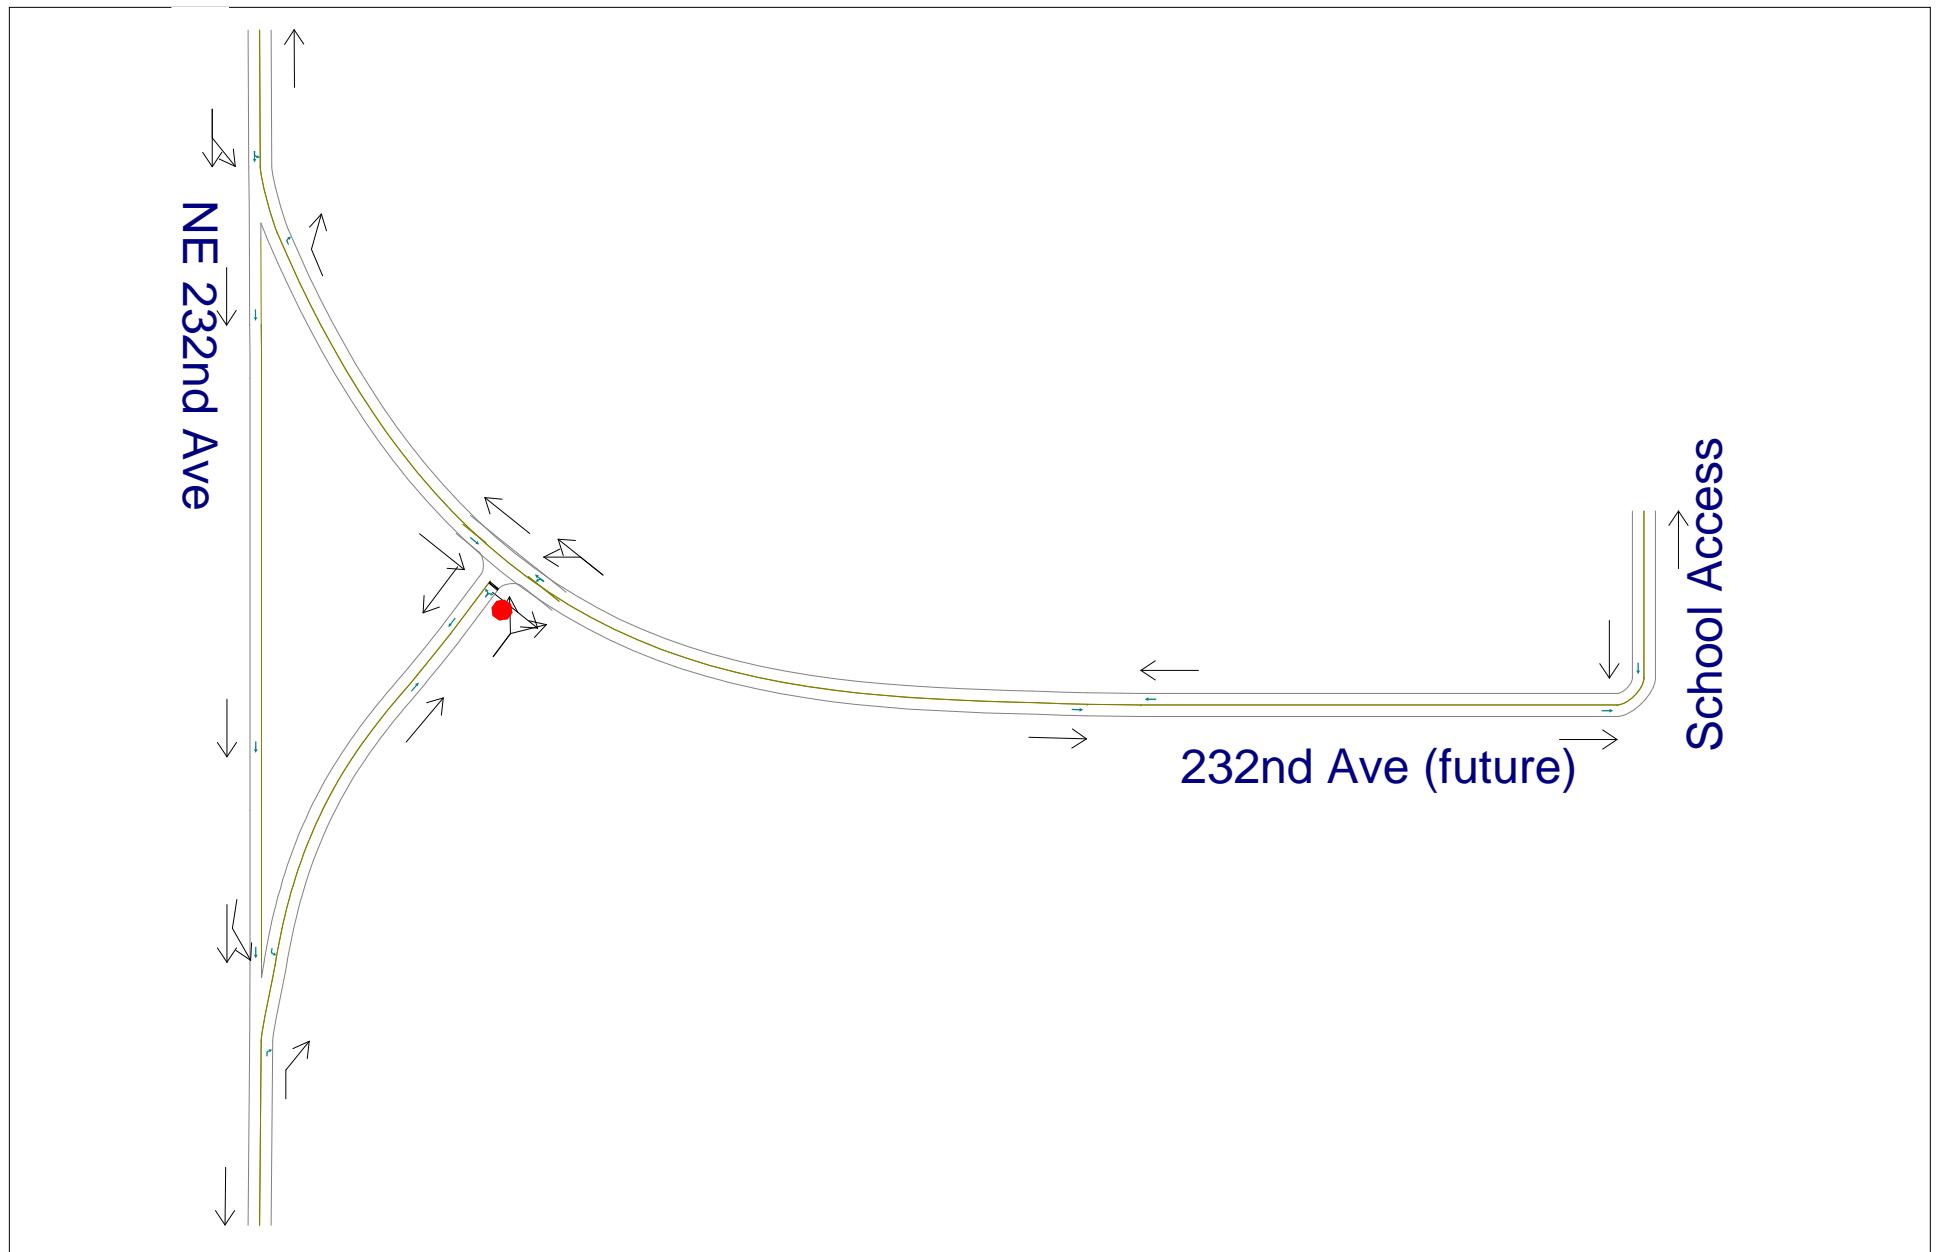

Figures 1-3 represent the year 2025 traffic flow conditions at the study intersection for the AM, mid-afternoon, and PM peak hours. Synchro v9 traffic software applying the year 2010 Highway Capacity Manual methodology was used to determine the LOS results for each of the peak hour periods. Under stop control on the northbound approach the intersection will operate at acceptable LOS 'B' or better during the peak hours (City's minimum LOS standard is LOS 'D'). The queuing analysis based on the 95<sup>th</sup> percentile value demonstrated that queues of one to two vehicles will occur on the stop approach. No queuing issues will occur on 232<sup>nd</sup> Avenue in conjunction with the left turn movement to head south.

The traffic analysis results documented that the intersection will operate at satisfactory levels well into the future and it is therefore recommended that the City of Camas support the proposed design.

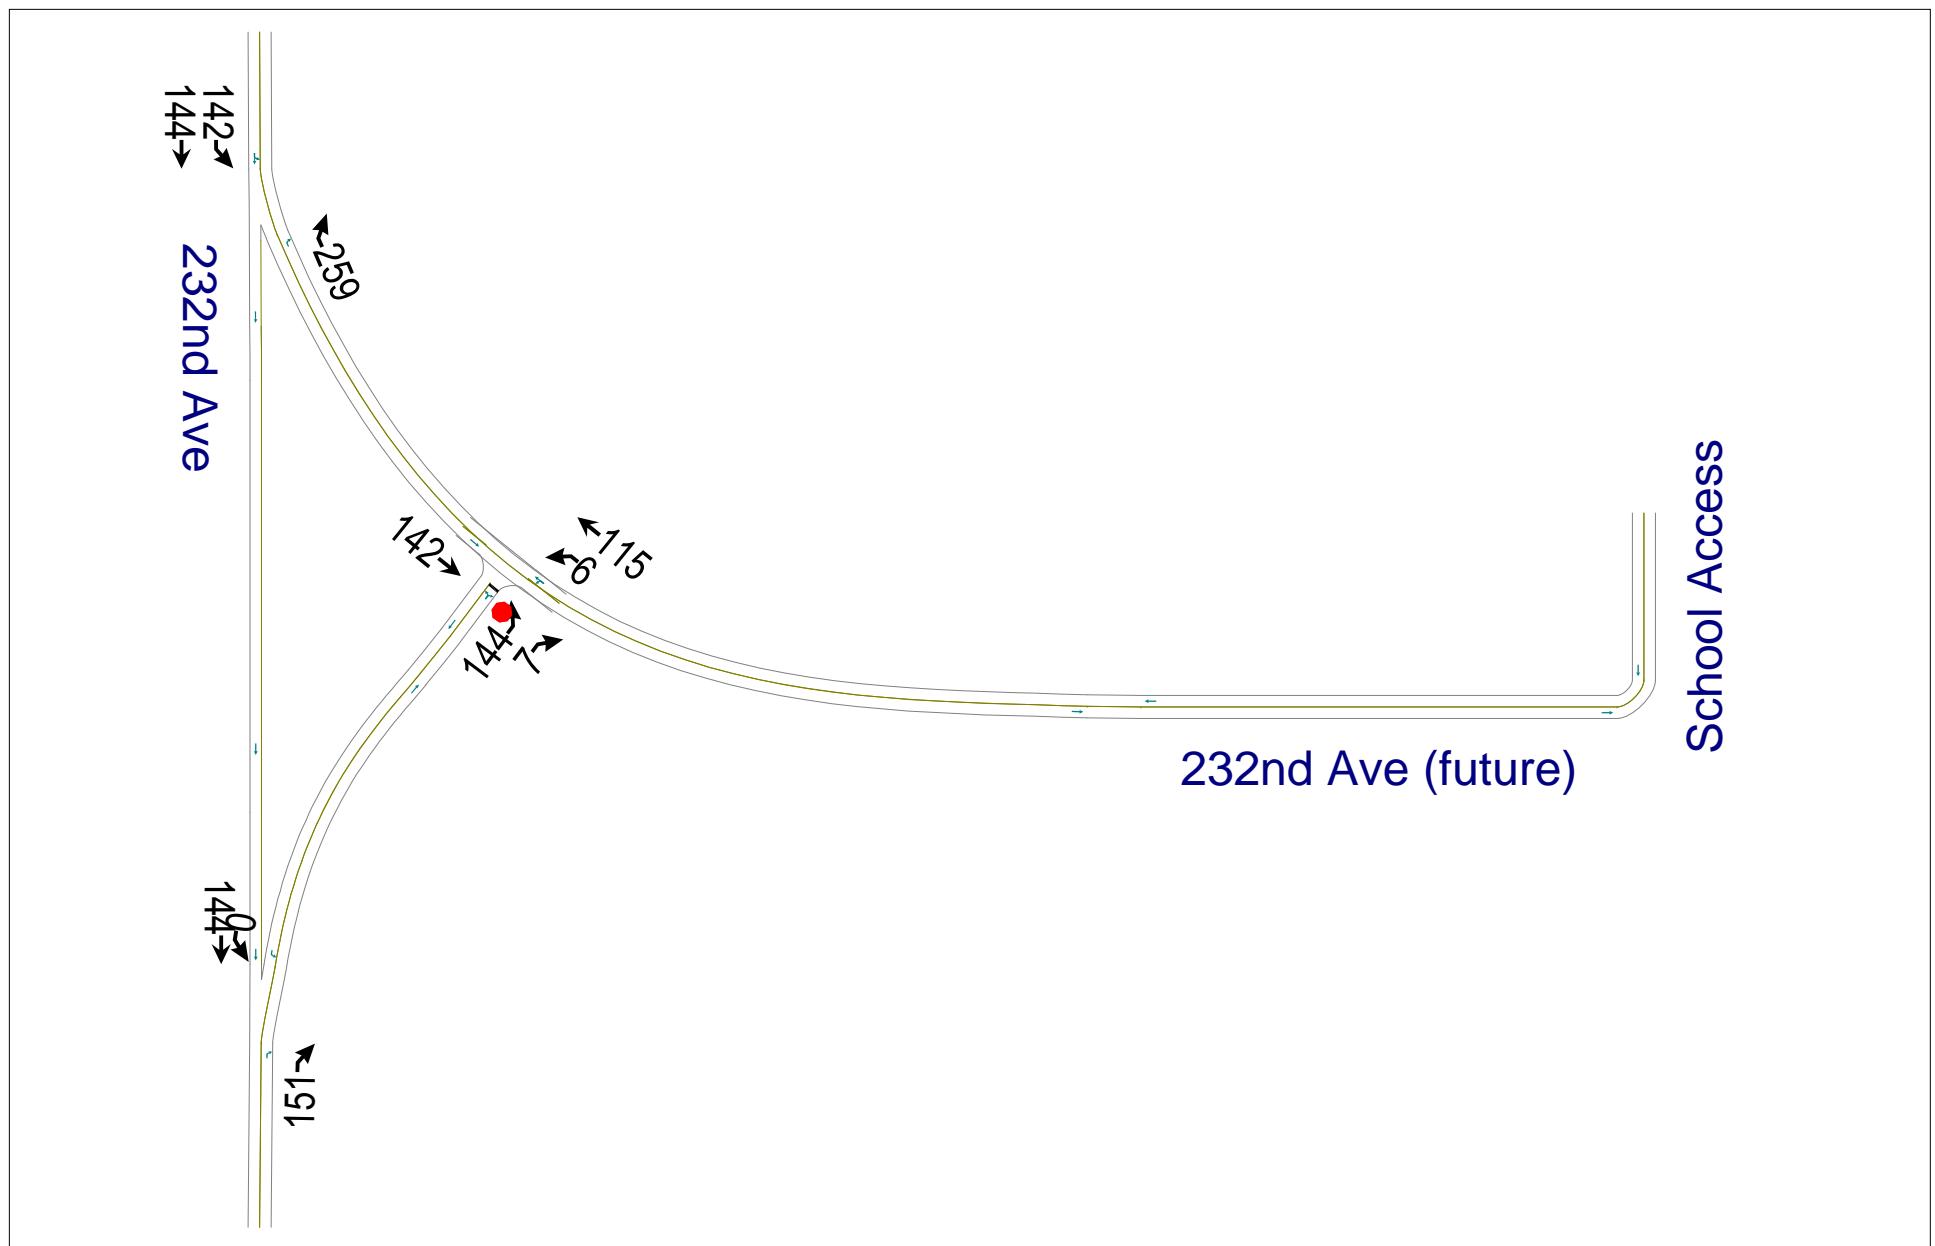

If you should have any questions, please contact Frank Charbonneau, PE, PTOE at 503.293.1118 or email [Frank@CharbonneauEngineer.com](mailto:Frank@CharbonneauEngineer.com).

### Trip Distribution

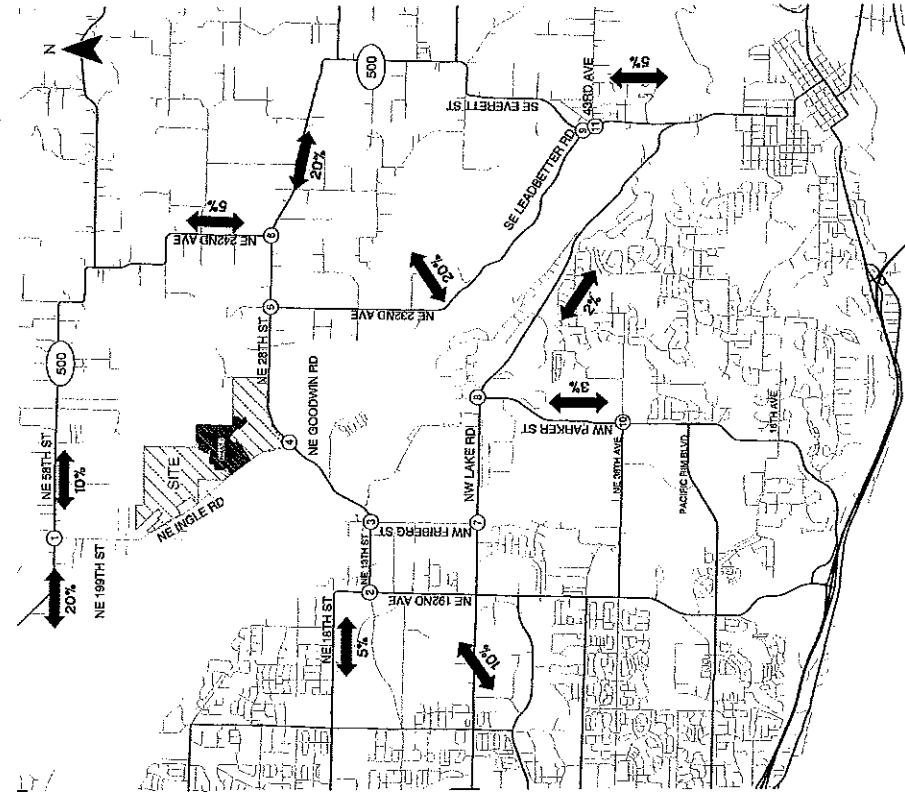

The distribution of site-generated trips onto the study area roadway system was estimated based on a review of surrounding roadway characteristics, existing uses, the 2035 travel demand model maintained by the Southwest Washington Regional Transportation Council (RTC), and review agency guidance. Trip distribution patterns were developed separately for the residential and retail trips. Figure 6 illustrates the trip distribution patterns for the residential and retail trips.

### Trip Assignment

The weekday a.m. and p.m. peak hour site trips shown in Tables 4 and 5 were assigned to the roadway network based on the trip distribution patterns shown in Figure 6. Figures 7 through 10 show the assignment of site-generated trips during the weekday a.m. and p.m. peak hours for Phase 1 and at Build-out. Note that the site-generated build-out volumes shown in Figures 9 and 10 include the Phase 1 site-generated trips and thus reflect the total number of trips generated. A figure showing the assignment of pass-by trips is provided in Appendix "E".

## **Traffic Volumes**

The traffic counts in this report were conducted from 7:00 to 9:00 am and 4:00 to 6:00 pm during February 2014. The AM peak hour occurred between approximately 7:15 to 8:15 am and the PM peak hour occurred between approximately 4:30 to 5:30 pm. The peak hour is the one-hour time period when traffic volumes are the highest and congestion on the adjacent streets is most likely to occur. The existing traffic volumes are shown in Figures 3a and 3b. The raw traffic count data is shown in Appendix A.

## **Trip Generation/Distribution**

The Green Mountain Estates subdivision could generate approximately 3,779 *new* trips per day, ITE Trip Generation Manual, 9<sup>th</sup> edition. A trip is a one-directional vehicle movement. Two hundred ninety-eight new trips could occur during the AM peak hour and 397 new trips could occur during the PM peak hour. The trip generation rates are shown in Table 1.

**Table 1, Site Traffic Generation**

Land Use	ITE code	Trip Generation	Units *	Trips/ Day	Trips/ AM Peak	Trips/ PM Peak
Single-Family Detached Homes	210	9.52/dwell unit-Day 0.75/dwell unit-AM Peak Hour 1.00/dwell unit-PM Peak Hour	400 - 3 existing = 397 new	3,779	298 (in-74, out-224)	397 (in-250, out-147)

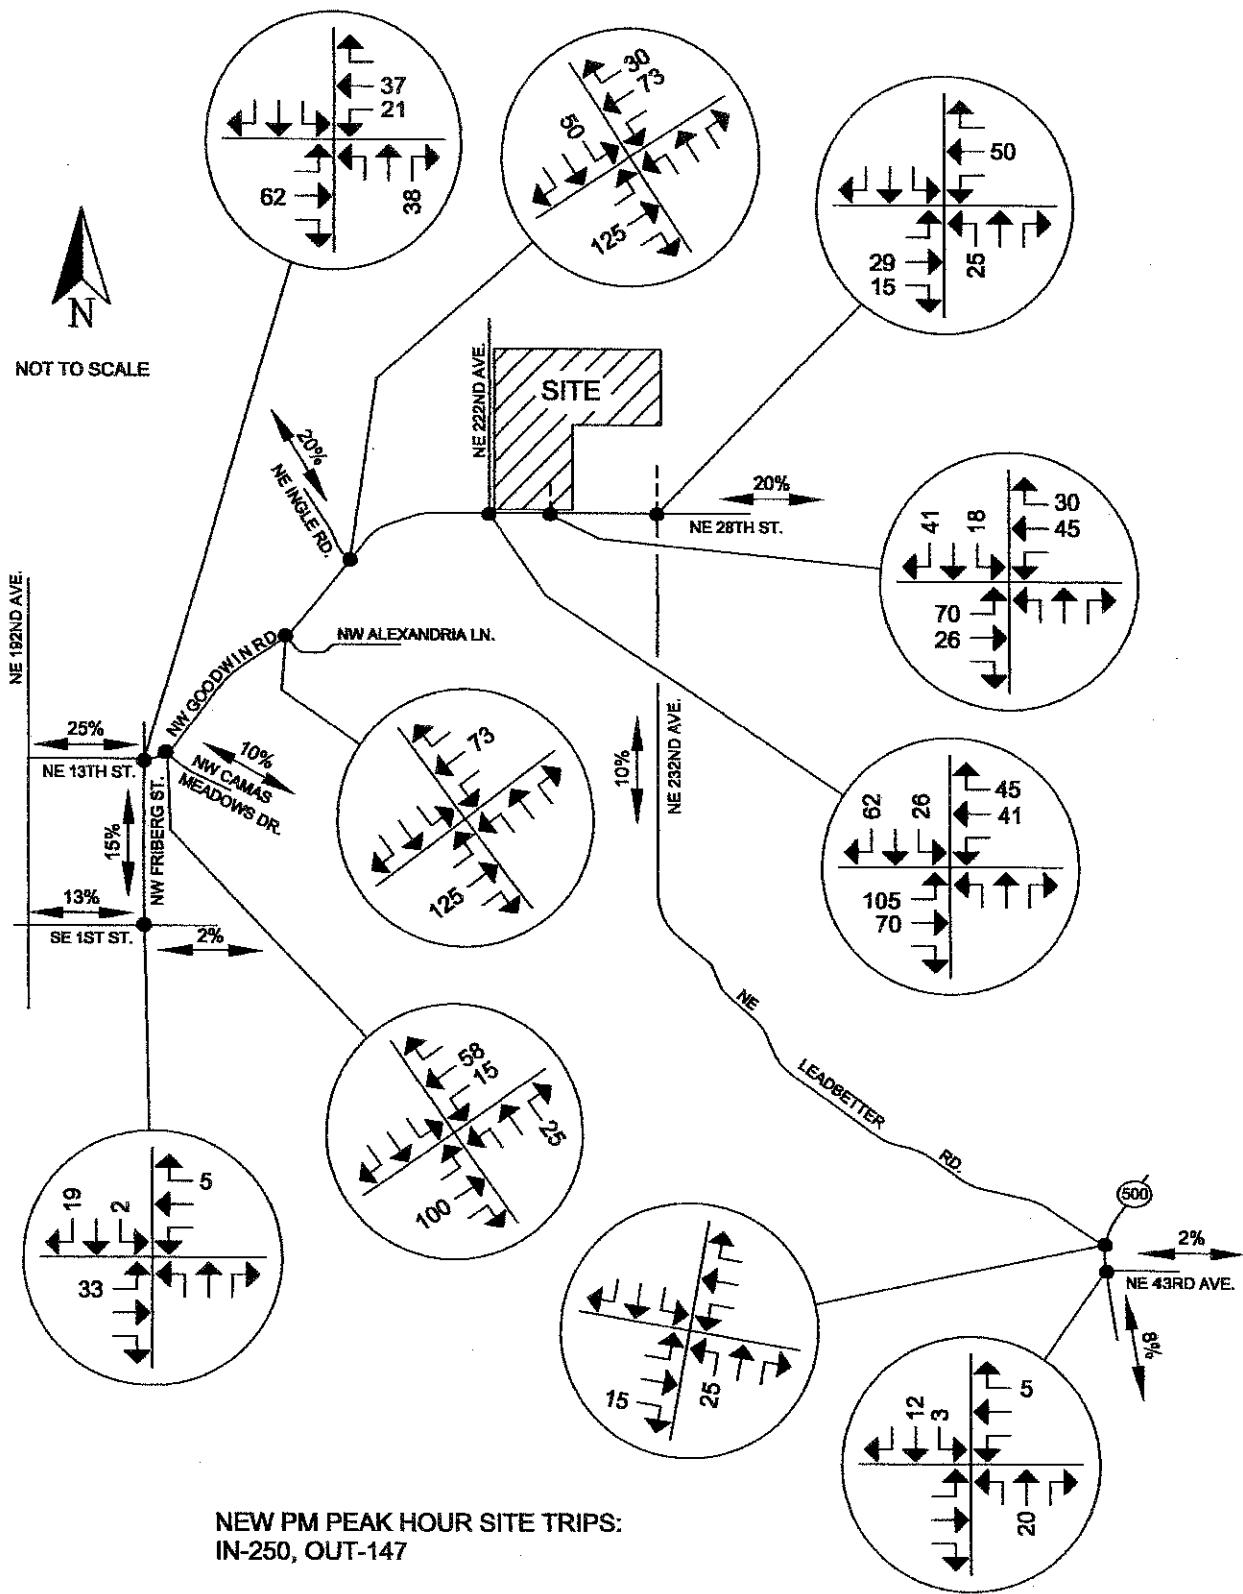

\* credit for the 3 existing homes was accounted for in the existing traffic volumes

The directional distribution of traffic generated by the development was assigned to the study area intersections. This distribution was based on the existing traffic volumes and discussions with staff from the City of Camas. The site traffic distribution and assignment are shown in Figures 7a through 7d.

## **Year 2019 Traffic Volumes**

The year 2019 traffic volumes at the study area intersections included in-process traffic from the Lacamas Prairie Estates PUD development. The Lacamas Prairie Estates PUD is a 176-lot development located at the NE 25<sup>th</sup> Street/NE 187<sup>th</sup> Avenue intersection in Clark County. The in-process traffic is shown in Figures 5a and 5b and was included to provide an analysis for build-out of the Green Mountain Estates subdivision, forecast year 2019 traffic conditions.

Figure 4 provides a summary of the existing turning-movement counts, which are rounded to the nearest five vehicles per hour for the weekday a.m. and p.m. peak hours, respectively. *Appendix "B"* contains the traffic count worksheets used in this study.

As shown in Figure 4, the study intersections operate acceptably during both study periods. *Appendix "C"* contains the existing conditions traffic operations worksheets.

## DEVELOPMENT TRIP GENERATION

As discussed above, the proposed development includes 179 single family units, which is a reduction of 25 units compared to the plan approved in 2006. Trip generation estimates for the currently proposed development were generated based on information provided in the standard reference manual *Trip Generation, 9<sup>th</sup> Edition* published by the Institute of Transportation Engineers (ITE – Reference 3). In the 2006 TIA, rates from the 7<sup>th</sup> Edition of the *Trip Generation* manual were utilized, which are slightly higher than those from the 9<sup>th</sup> Edition. Table 1 compares the trip generation from the current site plan with that previously proposed.

Table 1: Trip Generation Comparison

Scenario	ITE Code	Size	Daily	Weekday AM Peak Hour			Weekday PM Peak Hour		
				In	Out	Total	In	Out	Total
Current Site Plan	210	179 units	1,704	34	101	135	113	66	179
2006 TIA	210	204 units	2,004	38	114	152	128	75	203
Difference	-	-25 units	-300	-4	-13	-17	-15	-9	-24

As seen in the table, the current proposal results in 17 fewer trips during the a.m. peak hour and 24 fewer trips during the p.m. peak hour.

### ***Trip Distribution***

The distribution of site-generated trips onto the study area roadway system was estimated using the trip distribution pattern utilized in the 2006 TIA, accounting for the change in trip generation and new proposed access routes. The weekday a.m. and p.m. peak hour site trips shown in Table 1 were assigned to the roadway network based on the trip distribution pattern. Figure 5 shows the assignment of site-generated trips during the weekday a.m. and p.m. peak hours.
